HepcoMotion is pleased to be back at Germany's leading exhibition for the automation industry: Motek 2019, which takes place 7-10 October in Stuttgart. The producer of high quality linear and ring guide systems will be showcasing a selection of its extensive product range.

For 50 years, the company has been working tirelessly to support cutting edge automated technology with its products. In particular, the company made its name through the successful GV3 product range, based on the V guide technology originally conceived by the company's founder. Hepco's V guide products offer range of benefits which reduce the life cost of the system.

Stand visitors will be able to see examples of the GV3 range at Motek as well as, amongst other products, a demonstration unit of its DTS2 series. Using low maintenance V guide technology, this high speed driven track system allows rapid indexing with superior positional accuracy.

HepcoMotion's unique 1-Trak system offers design engineers freedom, with the ability to design a track system to nearly any conceivable shape, in conjunction with the Beckhoff eXtended Transport System (XTS). The system makes it possible to deal with a-synchronous work process at high speed and with absolute precision. A display unit of the system will also be at Motek.

All visitors are invited to attend one of our daily introductions every day at 2pm on the HepcoMotion stand hall 8, stand 101. Our sales engineers will also be happy to discuss your specific requirements in detail.
